

Two opposite mechanisms, one verdict: the 6N wing (p mod 3) reaches neither (wing effect |d| < 0.07 in both)

Test A — Galois fluid: a_7 IS a CRT coordinate
 $\eta^2(a_7 \mid p \bmod 7) = 1.000$ (absolute determinism)

Test B — Langlands plume: a_p is congruence-immune
 $\eta^2(a_p \mid p \bmod 12) = 0.002$ (absolute pseudo-randomness)
