

Theatre II: the wing split IS the $\chi(3)$ split (100% collinear for $p > 3$)
first-zero height is higher on the $\chi(3)=+1$ wing because $L(1,\chi)$ is larger there

$\gamma_1 * \log(p)$ (scale-normalised first zero height)

wing and $\chi(3)$ are the same partition — there is no "wing effect" independent of $\chi(3)$
